

Recall: Sylow Theorems

G a finite group $|G| = p^{\alpha}m$ $p \nmid m$

$Syl_p(G) = \{P \subset G \mid |P| = p^\alpha\}$ "the p -Sylow subgroups"

$$n_p(G) = |Syl_p(G)|$$

Theorem (s)

1. $Syl_p(G) \neq \emptyset$

2. $P, Q \in Syl_p(G)$

then $\exists g \in G$ s.t.

$$gPg^{-1} = Q$$

3. $n_p \equiv 1 \pmod{p}$

4. $n_p \mid \cancel{|G|} m$

Pf overview:

1: via induction & using class eqn & Cayley's thm

either: $\alpha=0$ ✓

$p \mid |Z(G)| \Rightarrow$ get normal subgp. for p

$\langle g \rangle$ product via $G/\langle g \rangle$

$p \nmid |Z(G)|$
shared $p \nmid [G : C_G(a)]$

$\Rightarrow p^\alpha \mid |C_G(a)|$ $C_G(a) \leq G$

(stry) indirect via $\cdot g C_G(a)$

Remark:

Considered conjugates of some $P \in \text{Syl}_p(G)$

$$\{gPg^{-1} \mid g \in G\} = P_1, \dots, P_r$$

$$(\doteq \text{Syl}_p(G)) \quad r = n_p !$$

mark

Consider Q some p -Sylow subgp.

we want to show: Q is on the list P_1, \dots, P_r

we also want $r = n_p \equiv 1 \pmod{p}$

Observation: $r \mid |G|$ because P_1, \dots, P_r are single orbit for G under conjugation.

$\{P_1, \dots, P_r\}$ orbit of P_1 under G

$2 \Rightarrow 4$

$$r = \frac{|G|}{|\text{Stab}_G(P_1)|} \text{ and } P_i \subset \text{Stab}_G(P_1) \quad |\text{Stab}_G(P_1)| = p^{\alpha} l \quad r = \frac{p^{\alpha} m}{p^{\alpha} l}$$

if Q acts on P_1, \dots, P_r via conjugation $\quad l = \frac{m}{r}$

central observation: if Q fixes some P_i

then $Q = P_i$.

$Q \neq P_i$

i.e. an orbit can only have size 1 if it is $\{Q\}$

$Q \subset N_G(P_i)$

thus $l \mid n_{N_G(P_i)}(P_i) \leq n_{N_G(P_i)}(P_i) = p^{\alpha} m$ so all other orbits have size mult. of p (ashut-sht)

$$\begin{aligned}
 & Q = P_i \rightarrow Q \text{ fixes } P_i, \text{ none of the others} \\
 & (\text{Ann}_{N_G(P_i)})P_i = P_i \quad P_1, \dots, P_r \text{ union of orbits, all mult. of } p \\
 & \downarrow \quad \text{except 1.} \\
 & (\text{Ann}_{N_G(P_i)}) \geq \text{Ann}_{P_i} \\
 & r \equiv 1 \pmod{p} \quad (2 \Rightarrow 3)
 \end{aligned}$$

Q any p -Sylow if $Q \neq P_i$ any o's
 then it stabilizes more than -all orbits
 size > 1 (mult. of p)
 $\Rightarrow r \text{ mult. of } p$ ~~*~~
 \Rightarrow stabilizes one \Rightarrow it is one of them
 $\Rightarrow \text{Syl}_p(G) = \{P_1, \dots, P_r\}$
 or arbit. $r \in Syl_p(G)$
 $n_p = r \quad \square$

Q acts on set $\{P_1, \dots, P_r\}$ (r elements)

$$\text{by } g \cdot P_i = g P_i g^{-1}$$

orbit of P_i under action of Q =
 $\{g P_i g^{-1} \mid g \in Q\}$
 is an orbit of G so size divides $|G|$
 $\{P_1, \dots, P_r\}$ is a union of these disjoint

$$|\{gP_i g^{-1} \mid g \in G\}| = \begin{cases} 1 & \text{if } Q = P_i \\ \text{mult of } p & \text{else.} \\ \uparrow \\ \text{a number, not 1, maybe } 12 \\ \ddots \\ P_i \end{cases}$$

Correspondence theorem

$$G \text{ a gp, } N \triangleleft G, \quad \overline{G} = G/N$$

then given $H \triangleleft G$, with $N \triangleleft H$ then $N \triangleleft H$

and we can consider H/N .

if we are given $K \triangleleft \overline{G}$ some subgp

$$\text{can consider } \tilde{K} = \{h \in G \mid hN \in K\} \triangleleft G$$

Theorem is: get a bijective correspondence

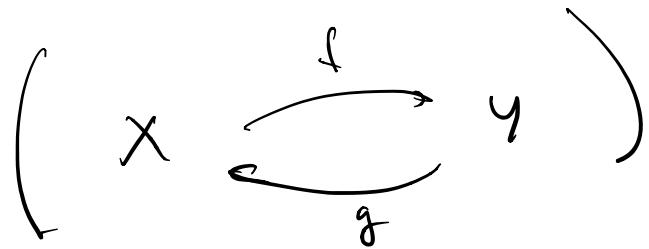

$\{ \text{subgroups of } G \text{ containing } N \}$

$\{ \text{subgroups of } G/N \}$

$$N \triangleleft H \triangleleft G \xrightarrow{\quad} H/N \triangleleft G/N$$

$$\tilde{K} \triangleleft G \xleftarrow{\quad} K \triangleleft G/N$$

i.e. $\overbrace{H/N}^{(H/N)} = H \text{ if } N < H < G$
 and $K = \overbrace{K/N}^{K/N} \text{ if } K < G/N$

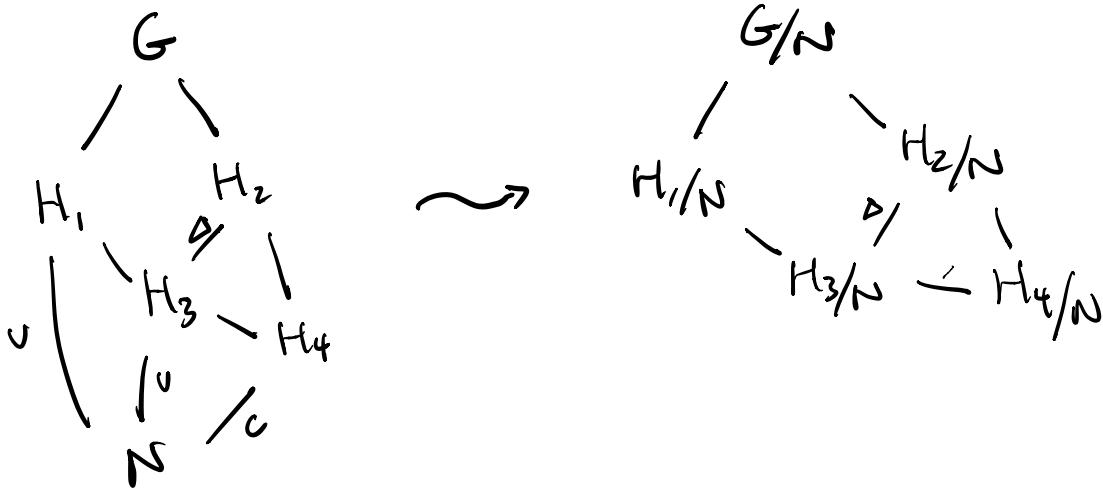

Further:

$$\text{given } N < H_1, H_2 < G$$

$$\text{then } H_1 \triangleleft H_2 \Leftrightarrow H_1/N \triangleleft H_2/N$$

$$\text{and } H_1 \triangleleft H_2 \Leftrightarrow H_1/N \triangleleft H_2/N$$

$$\text{and } H_2/H_1 \simeq \frac{(H_2/N)}{(H_1/N)}$$

Final Sylow thought

if $P \in \text{Syl}_p(G)$ an $n_p(G) = 1$
then $P \trianglelefteq G$.

$$gPg^{-1} \in \text{Syl}_p(G) \Rightarrow gPg^{-1} = P.$$

$$|G| = 18 \quad P_3 \in \text{Syl}_3(G) \quad |P_3| = 9.$$

$$P_3 \triangleleft G$$

$$P_3 \stackrel{?}{\sim} C_3 \times C_3$$

or C_9

$$\begin{aligned} n_3 &\mid \cancel{18} \\ n_3 &\equiv 1 \pmod{3} \end{aligned} \quad \left. \right\} \Rightarrow n_3 = 1.$$

"Fundamental
theorem of
Abelizing"

fundly gen.
any Alg. gr. is a product
of cyclic grs.

$$|G|=21 \quad P_7 \triangleleft G \quad G/P_7 \cong C_3$$

$$\begin{array}{l} n_7 \equiv 1 \pmod{7} \\ n_7 \mid 3 \end{array} \quad \left. \begin{array}{l} n_7 = 1 \\ n_7 = 1 \end{array} \right\} \quad P_7 \cong C_7$$

$$|G|=30 \quad n_5 \equiv 1 \pmod{5} \quad \left. \begin{array}{l} n_5 = -1, 6 \\ n_5 \mid 6 \end{array} \right\}$$

$$\begin{array}{l} n_3 \equiv 1 \pmod{3} \\ n_3 \mid 10 \end{array} \quad \left. \begin{array}{l} n_3 = 1, 10 \\ n_3 = 1, 10 \end{array} \right\}$$

$$\begin{array}{l} n_2 \equiv 1 \pmod{2} \\ n_2 \mid 15 \end{array} \quad \left. \begin{array}{l} n_2 = 1, 3, 5, 15 \\ n_2 = 1, 3, 5, 15 \end{array} \right\}$$

Claim either $n_5=1$ or $n_3=1$

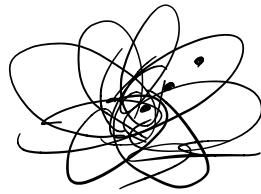

contradiction if $n_5=6, n_3=10$

$$24 = 4 \cdot 6 \text{ elements of order } 5$$

P_5 P_5'
 $P_5 \cap P_5' < P_5, P_5'$
 $(P_5 \cap P_5') \mid 5$

Sylow tricks

- play numerology, try to get $n_p = 1$ some p.
- if doesn't work and n_p 's large, try to count elements & run out of mem.
- if some n_p is very small ...
