

5 identical balls distributed to 10 students

Insert dividers to keep student's property to themselves

pattern of balls & dividers

o|oo||o|||||o      9 dividers  
5 balls

# of such patterns

= # ways to choose which of the 14 symbols  
are balls & which are dividers

$$= \binom{14}{5,9}$$

Abstract Problem:

How many ways can we choose nonnegative numbers

$$x_1, x_2, \dots, x_n \text{ such that } \sum x_i = r$$

some  $r$

answer = need  $n-1$  separators &  $r$  balls

$$\binom{r+(n-1)}{r, n-1} = \binom{r+n-1}{r}$$

---

## Multinomial Coefficients

Counts the number of ways to distribute objects into groups.

Given  $n$  labelled/distinguishable objects to distribute into  $k$  labelled/distinguishable groups of size  $n_1, n_2, \dots, n_k$  ( $\sum n_i = n$ )

# of ways is called  $\binom{n}{n_1, n_2, \dots, n_k}$

Ex  $\binom{n}{1, 1, 1, \dots, 1} = n!$

$$\binom{n}{k, n-k} = \binom{n}{k} = \binom{n}{n-k} = \frac{n!}{k!(n-k)!}$$

$$\binom{10}{3,3,2,2} = \binom{10}{3} \binom{7}{3,2,2} = \binom{10}{3} \binom{7}{3} \binom{4}{2,2}$$

first choose 3 for gp 1 =  $\binom{10}{3} \binom{7}{3} \binom{4}{2} \binom{2}{2}$   
 then distribute remaining 7

$$= \frac{10!}{3! \cancel{7!}} \frac{\cancel{7!}}{3! \cancel{4!}} \frac{\cancel{4!}}{2! \cancel{2!}} \frac{2!}{2! \cancel{0!}}$$

$$= \frac{10!}{3! 3! 2! 2!}$$

General Formula  $\binom{n}{n_1, n_2, \dots, n_k} = \frac{n!}{n_1! n_2! \dots n_k!}$

Why are these called multinomial coefficients?

$$(x_1 + x_2 + \dots + x_k)^n$$

coeff of  $x_1^{n_1} x_2^{n_2} \dots x_k^{n_k}$  is  $\binom{n}{n_1, \dots, n_k}$

$$(x_1 + x_2 + x_3 + x_4)^{10} \text{ coeff of } x_1^3 x_2^3 x_3^2 x_4^2$$

toil!

$$(x_1 + x_2 + x_3 + x_4)(x_1 + x_2 + x_3 + x_4)(x_1 + x_2 + x_3 + x_4) \dots$$

3

3

$$x_1^3 x_2^3 x_3^2 x_4^2$$

choose which 3 terms cont.  $x_1$   $\binom{10}{3,3,2,2}$   
 " 3 - - -  $x_2$   
 " 2 - - -  $x_3$   
 " 2 -  $x_4$

read ch 1!

## Probability (Chap 2)

The basic object in probability theory  
 is the probability space.

Set  $S$  = "sample space"  
 interpreted as set of possible  
 outcomes of experiments

subsets of  $S$  are called "events"

exr experiment = flip a coin twice.

$$S = \{(H,H), (H,T), (T,H), (T,T)\}$$

$$E = \{(H,H), (T,T)\}$$

Formally: A probability space consists of 3 datum

Set  $S$  = sample space

(Collection  $\Omega$  of subsets of  $S$  called events)

Function  $P: \Omega \rightarrow \mathbb{R}$

such that some axioms hold:

(0)  $\Omega$  satisfies some axioms that (won't mention)  
often  $\Omega =$  all subsets

1)  $P(E) \in [0,1]$

2)  $P(S) = 1$

3) If  $E_1, E_2, \dots \in \Omega$  and  $E_i \cap E_j = \emptyset$   
then  $P(\bigcup_i E_i) = \sum_i P(E_i)$

## Set Theory notation & operations

Fixed set  $S$ ,  $E, F, G \subset S$

$$E^c = S \setminus E = \{x \in S \mid x \notin E\}$$

$$E \cup F = E + F = \{x \in S \mid x \in E \text{ or } x \in F\}$$

$$E \cap F = EF = \{x \in S \mid x \in E \text{ and } x \in F\}$$

Commutativity, associativity, distributivity:

$$E + F = F + E \quad EF = FE$$

$$E + (F + G) = (E + F) + G \quad (EF)G = E(FG)$$

$$E(F + G) = EF + EG$$

$$\text{de Morgan's Laws } (E_1 + E_2 + \dots + E_n)^c = E_1^c E_2^c \dots E_n^c$$

$$(E_1 E_2 \dots E_n)^c = E_1^c + \dots + E_n^c$$

$$\boxed{(E_1 + E_2)^c = E_1^c E_2^c} \quad \leftarrow \underline{\text{Prove this}}$$

Hint

$$A + B = A + BA^e$$
